

ABSTRACT OF THE DISCLOSURE

A pieced flooring includes at least four rectangular floorboards connected to one another. Each floorboard includes four edges each having a series of dovetail tenons laterally extending from the edges of each of the floorboards and a dovetail mortise defined in the floorboard between every two adjacent dovetail tenons for complementally receiving a corresponding one of the dovetail tenons of an adjacent floorboard. Each floorboard includes four corners each having a cutout defined in the floorboards such that an opening is centrally defined in the pieced flooring relative to the at least four floorboards that are connected to one another. At least one insertion is fixedly inserted into the opening and having an area greater than that of the opening to prevent the insertion from detaching from the pieced flooring and to promote the connection between the floorboards.
